

ABSTRACT OF THE DISCLOSURE

A header connector apparatus (10) is configured to receive an electronic card (11). The apparatus (10) includes a body (12) having first and second spaced apart side arms (14, 16) formed integrally with the body (12) and configured to receive the card (11) therebetween. The first side arm (14) has a longitudinally extending first dovetail member (52). The apparatus (10) also includes an actuator button (48, 70) having a longitudinally extending second dovetail member (54, 74) configured to mate with the first dovetail member (52) to allow the button (48, 70) to move longitudinally relative to the body (12), and an ejector mechanism (36) coupled to the body (12) and the button (48, 70). The ejector mechanism (36) is configured to eject the card (11) from the body (12) upon longitudinal movement of the button (48, 70) relative to the body (12).
